

How Traitfolio Estimates an NFT's Value

Every Traitfolio estimate is built from the same transparent pipeline. We start from what the market will actually pay (the floor), add what rarity and collector appeal are worth, then let **real recent sales** pull the number toward reality. Where the sales evidence is thin, we lean on our formula; where it's strong, the sales lead. Every estimate is anchored at or above the collection floor.

The formula

```
estimate = floor + rarity premium + collector appeal
final = blend( estimate , recent sales ) weighted by confidence, floored
```

Step by step

1 Floor — the anchor

The cheapest clean XCH price you can actually buy at, across MintGarden and Dexie. We use a robust floor (not a single troll listing) and we exclude offers that secretly require a CAT token. Most of the value lives here.

2 Rarity premium — OpenRarity

We rank every NFT with OpenRarity, the industry-standard rarity method, using MintGarden's official rank where it exists and our own matching calculation where it doesn't. Rarer pieces earn a premium over floor that rises steeply for the top few percent.

3 Collector appeal — special numbers

Coveted mint numbers (69, 420, 777, #1, palindromes, runs...) add a small, capped desirability premium. Grails move the needle; the rest are mostly for fun.

4 Sales comps — the reality check

We pull real recent clean-XCH sales for the collection and build two signals: a rank→price curve (so each NFT learns from sales of similar-rarity pieces) and per-trait premiums (so a coveted trait earns a real, sales-derived bump). The final estimate is blended toward these comps. Comps can move an estimate DOWN as well as up, and a single sale ripples to its rank-neighbours and trait-siblings.

5 Confidence & range

Every estimate carries a confidence driven by how much recent sales data backs it. High confidence → the comps lead; low confidence → we lean on the formula. We show a range, not just a point, and never claim more certainty than the data supports.

Worked example

What we see	Effect on estimate
Collection floor	5.00 XCH (anchor)
Rank #843 of 9,985 (rare)	+ rarity premium → 9.00 XCH
14 recent sales near this rarity ~ 5–7 XCH	comps pull 9.00 → 7.20 XCH (78% confidence)
Traitfolio estimate	7.20 XCH · range 6.4–8.1
